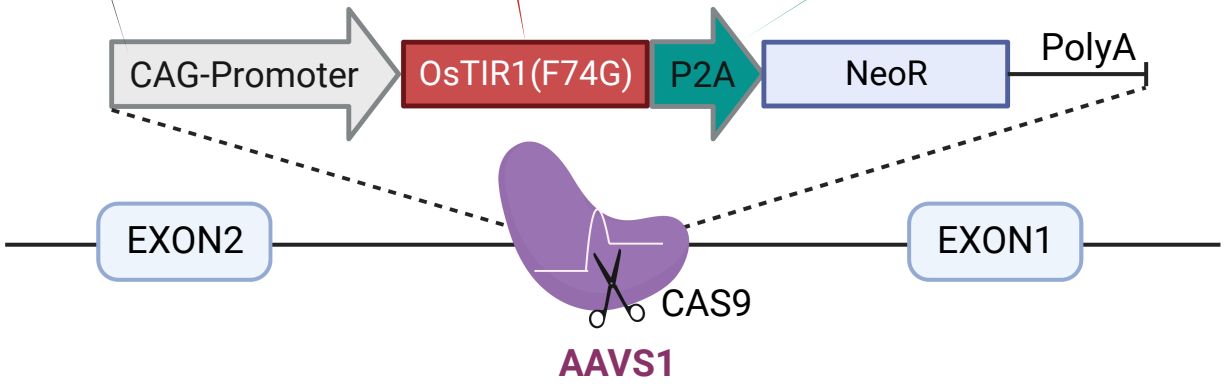
CMV-Promoter can be silenced by **DNA methylation and histone deacetylation (only in ESCs)**. Thus, CAG-Promoter has been selected.

2A peptide ---- corresponding one to one expression for 2 proteins / causing the ribosome to **fail** at making a peptide bond.

2nd generation degron protein ---- higher efficiency, with less basal degradation activity compared to 1st generation



A safe harbor locus ---- no side effects on genome integrity / exogenously inserted gene can maintain robust expression
